Powder coating is a type of dry coating, which is applied as a free-flowing, dry powder. The main difference between a conventional liquid paint and a powder coating is that the powder coating does not require a solvent to keep the binder and filler parts in a liquid suspension form. The coating is typically applied electrostatically and is then cured under heat to allow it to flow and form a "skin." The powder may be a thermoplastic or a thermoset polymer. It is usually used to create a hard finish that is tougher than conventional paint. Powder coating is mainly used for coating of metals, such as "white goods", aluminum extrusions, and automobile and motorcycle parts. As powder coating finishes vary in the baking process there may be some orange peel or other coating coverage differences. This is beyond our control. Jordan's Aluminum does not do the powder coat. We use an established well known company for this service. Jordan's Aluminum, Inc. warrants all extrusions and all product manufacturing. Any powder coat finish warranty if any will be provided by the powder coater.
