

Rolling Shutters

(Extruded Aluminum)

1200 Series - Florida Building Code & Dade County Approved.

Our “**1200 Series**” 55mm **Extruded Aluminum** shutter is the newest and best performing rolling shutter on the market today. It is extremely strong and exceeds the toughest impact and wind requirements set by Dade County.

The 1200 Series is specifically designed for maximum **hurricane** and **security** protection. It is ideal for any type of opening on all homes and businesses, especially in the costal areas.

The curved design of the shutters’ interlocking **door slat** with screw in guides allows us to use a smaller housing above the opening.

You can use the 55mm formula found on the “**Box Size and Capacity Chart**” page to determine the finished shutter size and square footage. This will help you pick the method of operation needed. Any of the operation methods are usable with the 1200 series shutter considering you don’t exceed the maximum weight limitations.

The **pull strap system** can be used up to 17 square feet of the finished size shutter. This shutter can be manually cranked with the use of an assist spring up to 65 sq ft of the finished size, as an example 8’ x 8’.

Any shutter larger than 65 sq ft will require a **motorized system**. A motor can be added as an option with a shutter of any size.

Storm bars and header may be required in certain zoned areas for openings larger than 62” in width. They will help reduce the amount of flexing during maximum wind pressures of 150 mph.

The “**1200 Series**” shutter system is used in residential homes, apartments, businesses, store fronts, high-rise buildings and condominiums, over garage doors, carports, trash areas, and many other places where **maximum hurricane and security** protection are needed. They can be used **inside** as a safe room retreat or as a partition between rooms as well. There are unlimited possibilities and options for this shutter depending on your needs.
